Uploading file .root

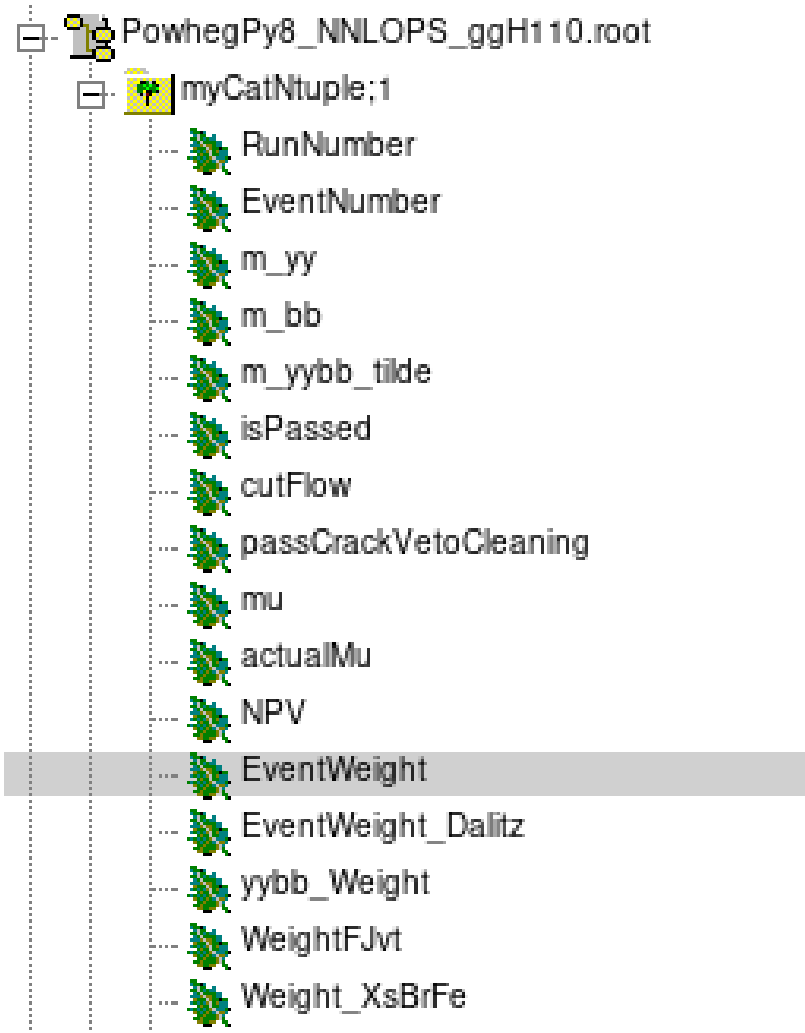
The file uploaded are:

- PowhegPy8_NNLOPS_ggH110.root;
- PowhegPy8_NNLOPS_ggH125.root;
- PowhegPy8_NNLOPS_ggH130.root;
- PowhegPy8_NNLOPS_ggH140.root;

Data

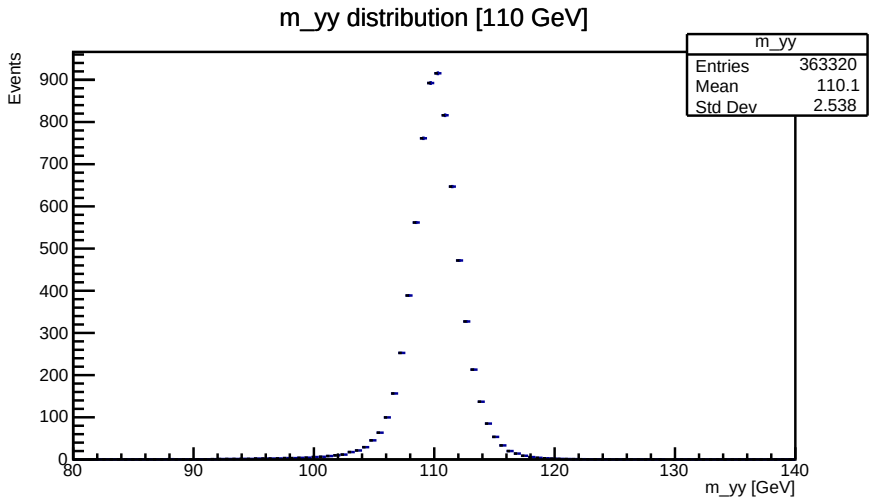
In each file, there is a `TTree myCatNtuple`, which contains all the variables. Only three of them were used:

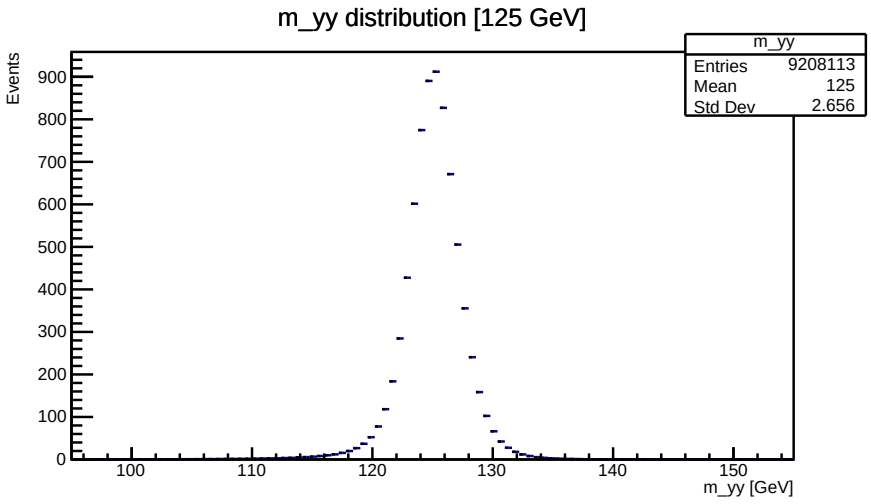
- **m_yy**;
- **EventWeight**: it contains all type of weights.
- **cutFlow**:———-

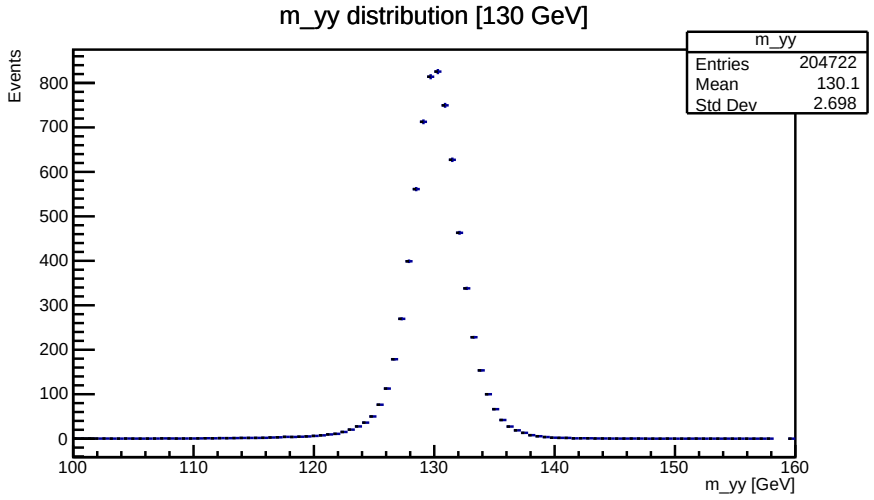


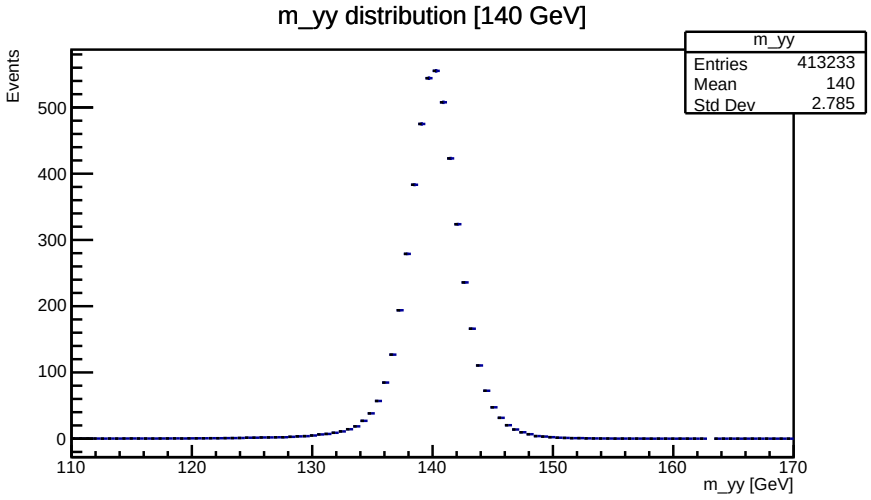
$m_{\gamma\gamma}$ distibution

Using all entries the distributions at different masses are:









Data analysis and fits

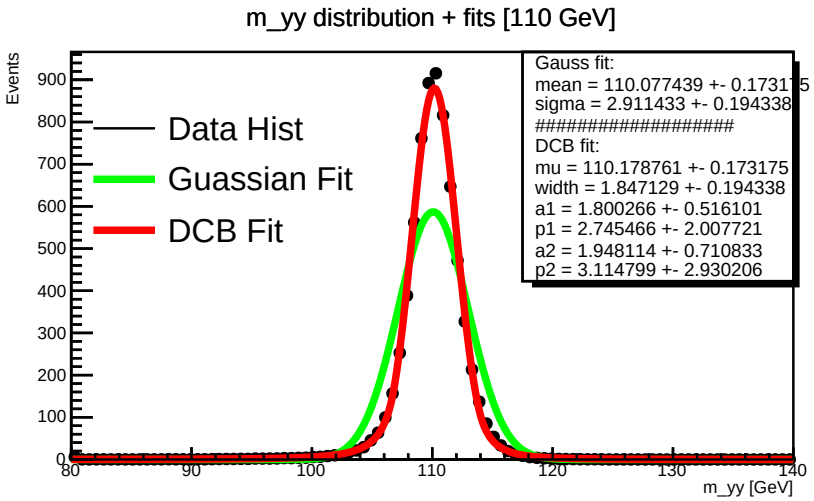
The distributions are fitted using two type of fit:

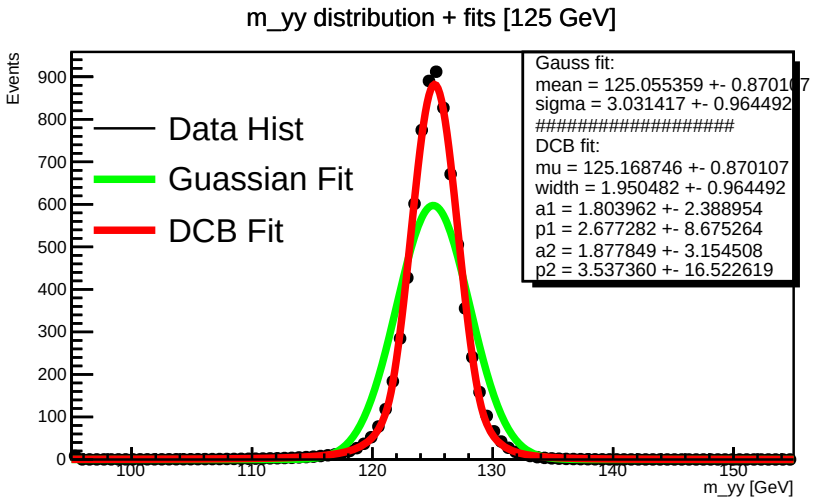
- **gaussian fit**: there are 2 parameters:
  - mean μ;
  - sigma σ;

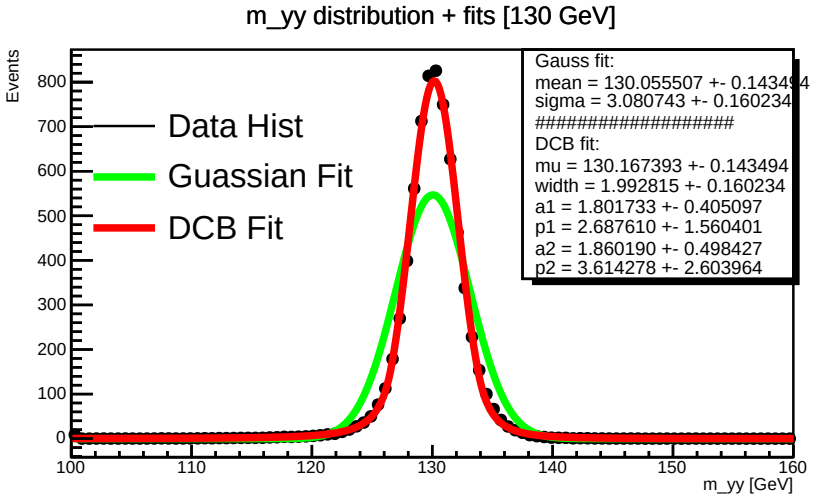
$$f(x, \mu, \sigma) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

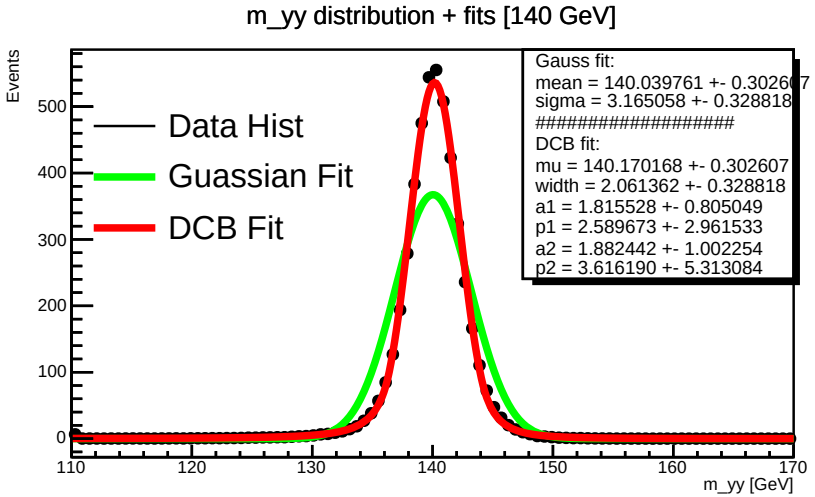
- **DCB fit**: there are six parameters:
  - mean μ;
  - sigma σ
  - a_1;
  - p_1;
  - a_2;
  - p_2;

$$f(x, \mu, \sigma, a_1, p_1, a_2, p_2) = \cdots$$

Gaussian and DCB fits








Applying the fits to all entries:
